TEST SCORES

Higher scores reflect greater use of each cognitive emotion regulation strategy.

- Self-blame – attributing responsibility for negative events to oneself. Higher scores indicate a stronger tendency toward self-criticism and personal fault attribution.
- Blaming others – attributing responsibility for negative events to other people or external factors. Higher scores indicate a greater tendency to externalize blame.
- Acceptance – acknowledging and accepting what has happened without attempting to change it. Higher scores indicate greater willingness to accept reality as it is.
- Refocus on planning – thinking about steps to deal with the situation. Higher scores indicate a more problem-solving-oriented approach.
- Positive refocusing – directing attention to pleasant or unrelated thoughts instead of the negative event. Higher scores indicate greater use of distraction through positive content.
- Rumination – repetitive focus on thoughts and feelings related to the negative event. Higher scores indicate a stronger tendency to dwell on distressing experiences.
- Positive reappraisal – finding positive meaning or personal growth in the situation. Higher

scores indicate greater use of cognitive reframing.

- Putting into perspective – downplaying the seriousness of the event by comparing it to other situations. Higher scores indicate a tendency to relativize negative experiences.
- Catastrophizing – emphasizing the negative and anticipating worst possible outcomes. Higher scores indicate a stronger tendency to magnify distress and perceive events as overwhelming.
