TEST SCORES

The results reflect two broad dimensions of affect: positive affect and negative affect. These dimensions are independent and describe different aspects of emotional experience.

- Positive Affect (PA) – reflects the extent to which a person feels enthusiastic, active, and engaged. Higher scores indicate greater energy, concentration, and pleasurable involvement, whereas lower scores reflect reduced energy, lethargy, and diminished positive mood.
- Negative Affect (NA) – reflects the extent of subjective distress and unpleasant emotional states. Higher scores indicate greater experience of emotions such as anxiety, anger, and guilt, whereas lower scores reflect calmness and emotional stability.

These dimensions can reflect both temporary emotional states and more stable tendencies toward positive and negative emotionality. Elevated negative affect and reduced positive affect are commonly associated with emotional distress.
